

**3.** A stainless steel canopy complements the building form and texture.

**4.** The side elevation of the building. Natural light penetrates through the floor plate because of the many openings being provided.

building, adding to the form and 'cool' impression of the building.

The building admeasures about 10,000sqft of columnless floor plate with two service cores, in the front and rear. The two circular towers house the front service block comprising the lift, lobby and staircase in one circular form and the directors/executives offices with conference rooms in the other. The nine-storey building has a typical floor plan, wherein each floor can be developed as per the corporate usage of it. Designed as per European standards, the building has natural lighting coming through two sides of the building reaching up to 7.5m from both sides.

Modern materials like heat-reflective blue laminated glass and ACP insulated panels for the building and stainless steel for the canopy complete the look.
